ABSTRACT

Designed to provide information on reasons for the enrollment decline of full-time, first-time-in-college students at Miami-Dade Community College (MDCC), this report presents data showing the patterns of Dade County public high school graduation and subsequent direct-entry enrollment into MDCC for the past 5 years. Introductory material provides background on declining first-time-in-college enrollments, and presents study methodology and results. Next, tables present: (1) a summary of graduation and MDCC enrollment patterns for each high school in the area for the past 2 years ordered by factors influencing MDCC headcount; e.g., whether there had been a decline in the absolute number of direct-entry graduates to MDCC, whether there had been a decline in the proportional draw to MDCC, whether MDCC was receiving fewer than 30% of the graduates as direct-entry students, and whether the school had fewer than 400 graduates; and (2) a summary of high school graduates by geographical area and subsequent enrollment at MDCC as direct-entry, first-time-in-college students for the years 1978 through 1982. The bulk of the report consists of data on direct-entry enrollments for four geographic areas, which including the number of students enrolling at MDCC from each graduating class and their distribution by campus; the percentage of direct-entry, first-time-in-college students; and statistics for each high school in that area individually. Finally, figures are presented illustrating enrollment data by campus and geographic area. (HB)

Patterns of Direct Entry Enrollment
of Public High School Graduates
into Miami-Dade Community College

Introduction

The student enrollment at Miami-Dade Community College for any given year consists of several components. The majority (70%) of our students are either new or continuing (other categories with substantial headcount are transfer students and former Miami-Dade students.) The largest new student category is first-time-in-college (J). First-time-in-college students form the base for future enrollment at the College since they are the pool from which the bulk of our subsequent continuing student population is drawn. Recent data indicate a decline in "J" enrollment across the past three years (Wright, 1983B). Since these "J" students form the base for future continuing students, it is not surprising to note that overall headcount at the College has also shown a decline (Morris, 1983).

Population projections for Dade County indicate that the county is still growing, and should continue to do so through 1990 (Smith and Sincich, 1982). While the proportion of 15-24 year olds was 16.6% in 1980, the projection for 1985 is 14.8%, and for 1990, 12.6%. Conversely, the proportion of 25-44 year olds is expected to increase from 26.7% in 1980, to 30.3% in 1985 and 32.1% in 1990. However, the absolute number of 15-24 year olds is expected to increase to 1985, and this population is the primary source of our first-time-in-college students. Eighty percent of "J" students are 25 years old or younger, and 65% are 20 years old or younger (Wright, 1983A). Given these facts, why is our "J" student enrollment declining?

The most obvious answer is that Miami-Dade is not drawing the same proportion of these younger residents as we have in the past. Some may be going to FIU, while others may simply not be continuing their education immediately. One primary source of recruitment for this age group is through the public high schools. This is probably the one place where targeting of efforts can make a difference on a relatively "captive"

audience. Approximately 40% of our "J" students are direct entry from high school (Morris, 1982, for fall plus winter figures. Annual figures are 40%). That is, they enter Miami-Dade within one year of their high school graduation. And, about two-thirds of these students come from Dade County public schools. Direct entry first-time-in-college students are the more "traditional" college students, and carry heavier credit loads. For Dade County high schools, almost 60% of direct entry students are full-time at Miami-Dade compared to only 17% of delayed entry students. The fact that direct entry students contribute more heavily to the college FTE is another argument for focusing on high school recruitment.

The number of Dade County public high school graduates has declined over the past few years, while private high school graduates are on the increase. While it is difficult to obtain detailed data from the private schools, data on public school graduates and their subsequent enrollment at Miami-Dade are available for each school. Since the public schools still provide about two-thirds of our direct entry "J" enrollment, an analysis by school should prove valuable in recruitment efforts. The purpose of the present report is to provide a detailed look at patterns of Dade County public high school graduation and subsequent direct entry enrollment into Miami-Dade for the past five years. It is hoped that these data will allow recruiters to target specific schools for more intensive efforts, and that the data will serve as a baseline against which to measure changes in subsequent years.

Method

The data base consists of all direct entry Dade County public high school graduates enrolled in Miami-Dade for the past five full academic years. Data were compiled from end-of-term computer files from 1978 through 1982. All "J" students were examined for high school graduation date and only those who showed a graduation date less than one year prior to their enrollment at Miami-Dade were counted as direct entry. Finally, high school codes were used to determine the high schools of origin for the direct entry students, and the subset of Dade County public high schools was examined. High school graduation figures for the years in question were obtained from Dade County public schools. The schools are

grouped by area for purposes of analysis. These area designations are the same ones established by Dade County public schools.

Results and Discussion

General Summary

Table 1 presents a broad summary of the findings of this report. Each public high school is listed in the Table along with the area of the county, the Miami-Dade campus drawing the most graduates from the school, and a set of factors which are examined in detail in the body of the report. Table 1 summarizes patterns for the last two years only. For each school, a notation ('X') is made as to whether there has been a decline in graduates from that school. Factors influencing Miami-Dade's headcount are grouped together and include: whether there has been a decline in the absolute number of direct entry graduates to Miami-Dade; whether there has been a decline in the proportional draw to Miami-Dade; and whether Miami-Dade is receiving fewer than 30% of the graduates as direct entry students. Finally, the last column on the table notes simply whether the school has fewer than 400 graduates, a number which seemed to mark a clear division between small and large high schools. The schools are arranged in an order that places the "worst" cases at the top of the Table.

The first three schools show a decline in high school graduates, a decline in Miami-Dade's absolute and proportional draw of these graduates, and are all schools from which we are getting fewer than 30% of the graduates on a direct entry basis. One of these schools (Miami Beach) has fewer than 400 graduates, but the other two are larger schools. For the next four schools on the Table, Miami-Dade's absolute and proportional draw of the graduates is declining, but we are attracting more than 30% of the graduates. None of these schools has fewer than 400 graduates. Note that these four schools are also showing a decline in the number of their graduates. The next two schools show a decline in Miami-Dade's absolute and proportional draw, but neither of them is showing a decline in graduates. Miami-Killian has more than 400 graduates, and we are attracting more than 30%. By contrast, Miami-Carol City has fewer than 400 graduates and our draw is less than 30%.

The next grouping of schools are mixed cases where either Miami-Dade's absolute draw has decreased, or Miami-Dade's proportional draw has decreased. For the first three schools with declining high school graduates, a decline in Miami-Dade's absolute draw is not surprising. Note that the proportional draw has not declined, indicating that the decline in absolute draw is simply a reflection of fewer graduates from these schools. The last three schools in this grouping are not showing a decline in graduates, but Miami-Dade's proportional draw has declined. For two of these schools (Northwestern and Norland), our draw is below 30% of the graduates.

The last nine schools on the Table are grouped according to the number of remaining factors that pertain to each school. Edison, Homestead, and Central are all showing a decline in high school graduates, and Miami-Dade's draw from these schools is below 30%. Note that both Edison and Homestead are schools with fewer than 400 graduates. Miami-Jackson, South Dade, and North Miami High Schools are showing no decline in graduates, but Miami-Dade's draw from these schools is below 30%. Note once again that two of these schools have fewer than 400 graduates. Taken together, the data for these six schools (Miami Edison through North Miami) seemed to suggest that the smaller schools may not have received the same intensive recruitment efforts as others. While both our absolute and proportional draw have remained stable, that draw is less than 30% of the graduates. Finally, the last three schools on the Table seem to exhibit no problems. Our draw from these schools is more than 30% of their graduates and there has been no decline in the absolute or proportional draw. One other important thing to note from the data in Table 1 is that data from schools in both the north and south areas show patterns that are not advantageous to Miami-Dade's headcount.

Table 2 presents a broad summary by area of the county and further illustrates this point. Note that there has been a decline in high school graduates in both the north and south areas. Note also that Miami-Dade's proportional draw of these high school graduates as direct entry "J" students has declined in the north area, in the north central area, and in the south area. The south central area shows a decline from 1980 to 1981, but a slight recovery for 1982.

Figure 1 is a visual display of these same data. Total high school graduates for each area and each year are grouped together. The bars for any given year represent the total high school graduates in the area, while the initials within the bar represent their location the year following graduation from high schools. The "X" symbol means that the graduate did not enter Miami-Dade. The reader can note again the definite decline in total graduates for the north area and the corresponding decline in a student's enrolling at Miami-Dade. The same pattern can be seen for the south central area from 1980 onward. A continuing enrollment decline may be expected unless the trends noted in this report are halted or reversed. Intense recruitment efforts may aid in breaking the pattern of declining enrollment of direct entry first-time-in-college students at Miami-Dade.

Summary - North Area Schools

Table 3 presents data by high school for the North area schools. The total number of direct entry students enrolling from each graduating class is displayed, and their distribution by campus is noted. The final column in the table gives the percent of direct entry "J" enrollees from each graduating class for each year. Figure 2 presents these same data graphically. Data are grouped by school and by year with the vertical bars representing the total graduates for each year. Once again, the "X" symbol represents the number of graduates who did not enter Miami-Dade the year following graduation.

Examination of both the table and the figure reveal a noticeable decline in high school graduates for 1982 at both Hialeah-Miami Lakes and Miami Beach high schools.

Miami-Dade's absolute and proportional draw from these two schools has also declined. Of all the North area schools, note that our draw from North Miami Beach high school is extremely small (less than 10% in 1982). In fact, for five of the North area schools, Miami-Dade drew fewer than 30% of the graduates in 1982 (Miami Norland through Miami Carol City.)

Figures 3 through 9 present data for each high school individually. At the bottom of each figure, the total number of high school graduates is noted as well as the number enrolling at Miami-Dade as direct entry students. The percent enrollment (Miami-Dade's draw) is also given. Finally, a note has been added to each table to aid in interpretation of the data. Absolute headcounts are given to the right in each figure (draw), and are also displayed visually. At the bottom of the figure are horizontal bars representing the headcount of graduates who did not enter Miami-Dade during the year following high school graduation. The details of each graph are left for the reader to examine.

1982	330	90	27.3

Note: While the number of H.S. graduates appear to be stabilizing, there is an absolute and proportional decline in MDCC draw for the past 4 years.

Summary - North Central Area Schools

Table 4 presents data for schools in the North Central area. The format of this table is the same as Table 3. Note once again that four of these six schools show a Miami-Dade draw of fewer than 30% of the high school graduates. Figure 10 presents a bar chart of the data in Table 4. The steady decline in high school graduates at Miami-Central is apparent in the figure and, in general, a declining trend can also be seen at Jackson and Miami Springs. Miami Springs does show a slight recovery in the number of high school graduates for 1982, as does Miami Northwestern. For Miami Northwestern, however, Miami-Dade's absolute draw did not increase for 1982, which means that our proportional draw of these graduates dropped from 32.6% in 1981, to 22.2% in 1982.

Figures 11 through 16 present detailed data for each high school. Once again, summary data and interpretive notes are provided on each figure. These data are left for the reader to examine.

Prior Year	Total H.S. Grads.	Number Enrolling MDCC	Percent
1978	677	293	43.3
1979	546	261	47.8
1980	506	220	43.5
1981	409	213	52.1
1982	448	218	48.7

Note: H.S. grads declined across first 4 years, but show increase in 1982. MDCC absolute draw mirrors this pattern, while proportional draw remains high.
Draw from this school and from Hialeah is the highest of any schools in the North and North Central area.

Summary - South Central Area Schools

Table 5 and Figure 17 present data for the South Central Area high schools. These schools exhibit an interesting mixture of growth and decline. Coral Gables and Miami Senior High both show a decline in high school graduates. Miami Coral Park and Miami Sunset High show an opposite trend.

Note also that this is the first set of schools for which Miami-Dade is drawing more than 30% of the graduates from each school. Our proportional draw has increased or remained stable for three schools, but has shown a decline for two schools (Coral Gables and South Miami). Figures 18 through 22 present detailed bar graphs for each school with summary data and interpretive comments.

Summary - South Area Schools

Table 6 and Figure 23 present data by high school for the South area schools. While not in every case apparent from the scale of the figure, the number of high school graduates has declined for four of the six schools in 1982 (Homestead, Miami Southridge, Southwest Miami, and Miami Palmetto). Notice also that while Miami Killian's high school graduating class has shown a recovery across the past three years, Miami-Dade's absolute and proportional draw has decreased considerably for 1982. Miami Palmetto presents an interesting case. It is a large school, but our draw has been fewer than 30% of the graduates for the past four years. A low draw is also apparent from South Dade and Homestead High Schools.

Figures 24 through 29 present detailed data for each high school. Once again, summary data for the high school and interpretive notes are provided on each figure.

	Prior Year Total H.S. Grads.	Number Enrolling MDCC	Percent
1978	570	216	37.9
1979	705	200	28.4
1980	753	174	23.1
1981	710	176	24.8
1982	670	150	22.4

Note: H.S. grads decreasing past 3 years. MDCC absolute and proportional draw declined for 1982.

Summary - Campus Draw From Each School by Area

Figures 30 through 42 present summary bar charts arranged by campus and area. Essentially, the head count draw from each school for a particular campus has been extracted from the area summary figures just discussed, and presented together in one graph. For example, Figure 30 shows the number of graduates from each North area school that enrolled at the North Campus for the given academic year noted at the bottom of the figure. These bars represent absolute draw. Thus, for example, in 1982, the North Campus received fewer students from Hialeah-Miami Lakes, Miami Beach, North Miami Beach, and Miami Carol City high schools that was true in 1981. Which of these schools showed an actual decline in high school graduates can be found by referring to the North Area Summary Table (Table 3).

The remaining figures present similar data to Figure 30 with campus held constant and the different county areas examined in each figure. Thus Figure 31 presents North Campus draw from North Central Area high schools, and Figure 32 presents North Campus draw from South Central Area high schools. In cases where an area of the county is not represented for a campus, the draw from the schools was so slight that a graphical display was not possible given the scale of the graph. These figures are left for the reader to examine.
